Brian Collins
Lab 10 questions

1. HAML is a language similar to HTML and is used to help with the interaction between a program and a web application. Downsides are it needs indents and its commands are not intuitive.
2. With cucumber, all tests and data are defined through file systems that make organization easier.
3. Small applications may not need a lot of tests, but large web applications would be better tested with cucumber tests, especially if there is a lot of repetition.
